# Module: m/06/101

'Understanding the timeware® fire roll-call…'

The timeware® fire roll-call sends a roll call report to pre-defined printers on the customers' network when a signal is received from the customer's fire alarm system.

The fire alarm may be connected to any timeware® terminal on the network. On a multi-site system, an alarm triggered at one location can produce reports locally and at head office.

For the timeware® fire roll-call to run correctly, the fire alarm roll-call service MUST be running on the timeware® server.
